HOW DOES VECTOR-VIRUS DIVERSITY INFLUENCE VIRUS-VECTOR-HOST INTERACTIONS

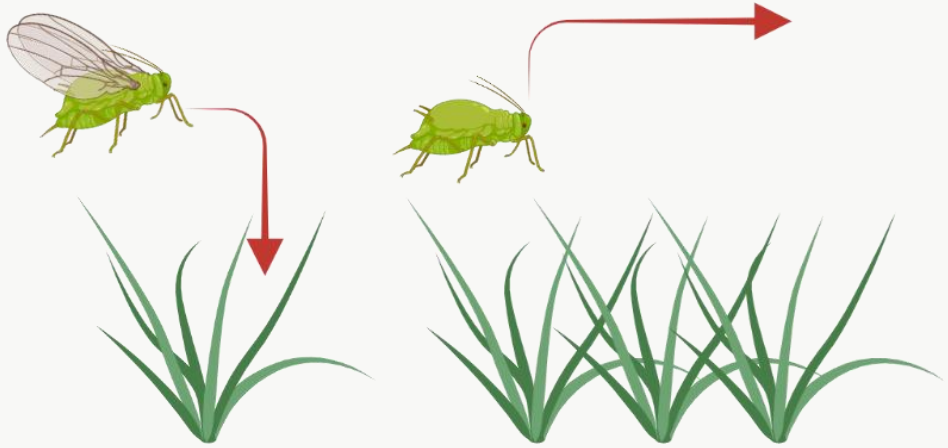

Dr Daniel Leybourne
1851 Research Fellow

September 2025

APHIDS: PERFECT DISEASE VECTORS

- Yellow dwarf viruses of significant importance in cereal systems
- Brought in by winged aphids
- Spread through crop by walking aphids
- Disease can reduce yield by 20-80%

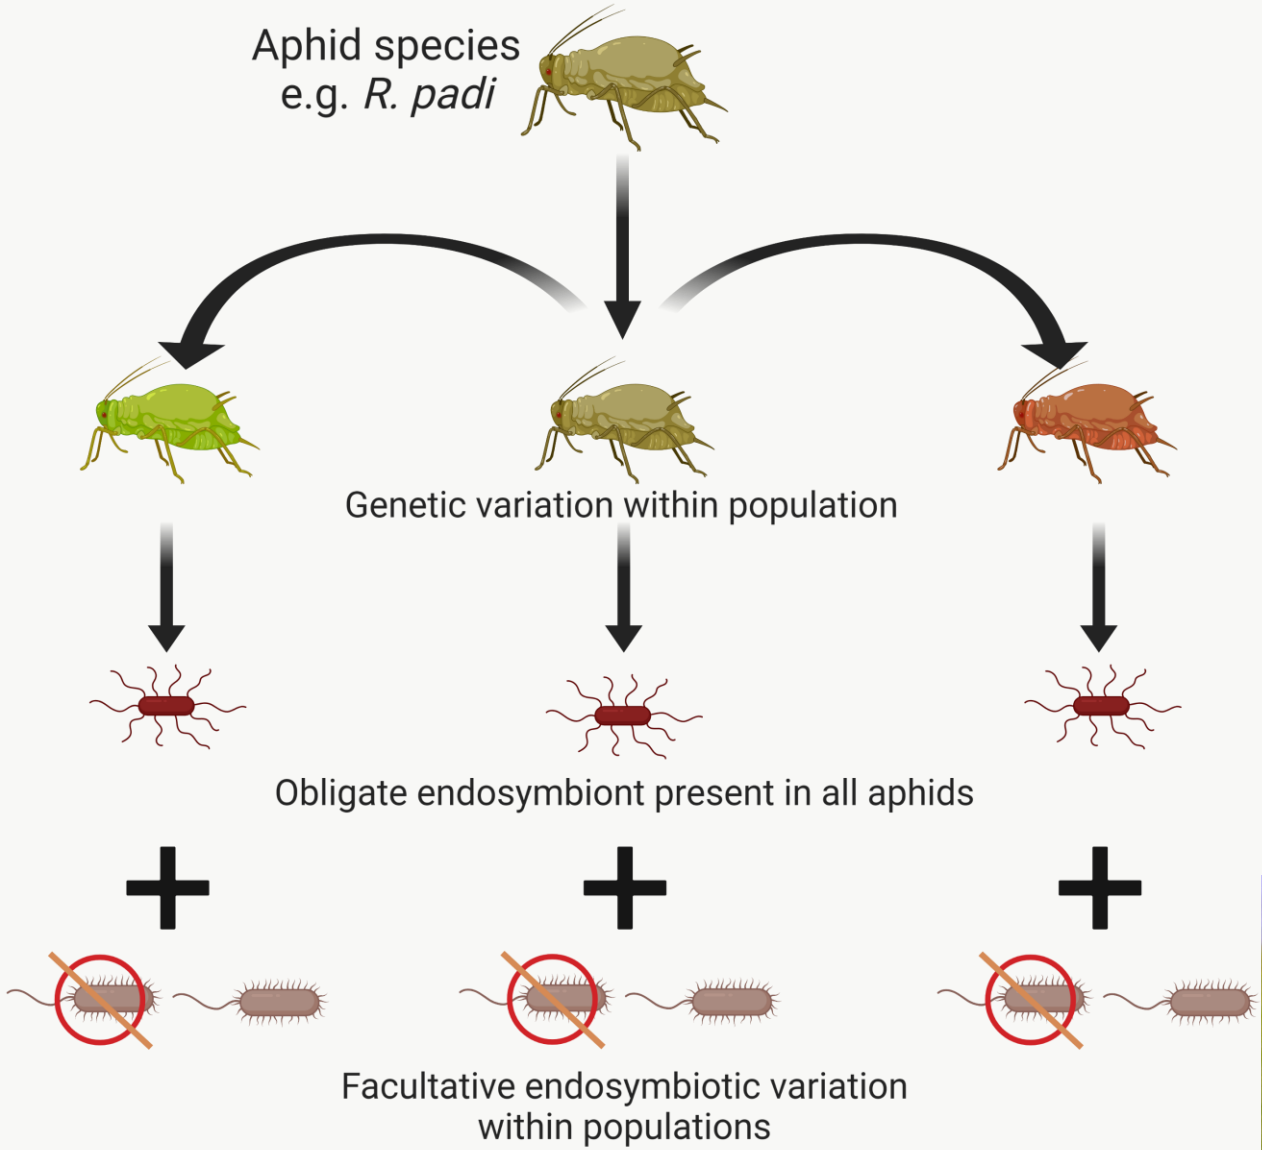

Virus species	Virus strain (updated name, if applicable)	Main vectors (average transmission efficiency >10%)
Barley yellow dwarf virus (*Tombusviridae*, *Luteovirus*)	BYDV-PAV (*Luteovirus pavhordei*)	*Rhopalosiphum padi*, *Sitobion avenae*, *Sitobion miscanthi*, *Sitobion fragariae*,[a] *Metapolophium dirhodum*, *Schizaphis graminum*
	BYDV-MAV (*Luteovirus mavhordei*)	*S. avenae*, *S. fragariae*,[a] *M. dirhodum*, *S. graminum*[b]
	BYDV-PAS (*Luteovirus pashordei*)	*Rhopalosiphum maidis*,[a] *R. padi*,[a] *S. avenae*,[a] *M. dirhodum*[a]
	BYDV-GAV	*S. graminum*, *S. avenae*
	BYDV-OYV	Vector not reported
	ker-II (*Luteovirus kerbihordei*)	*R. padi*[a]
	ker-III (*Luteovirus kertrihordei*)	*R. padi*[a]
Cereal yellow dwarf virus (*Solemoviridae*, *Polerovirus*)	CYDV-RPV	*R. padi*, *S. graminum*, *S. avenae*[c]
	CYDV-RPS	*R. padi*[a]
Maize yellow dwarf virus (*Solemoviridae*, *Polerovirus*)	MYDV-RMV	*R. maidis*, *R. padi*, *S. graminum*
Wheat yellow dwarf virus (*Solemoviridae*, genus unassigned)	WYDV-GPV	*R. padi*, *S. avenae*, *S. graminum*
Unassigned (*Solemoviridae*)	SGV	*S. graminum*, *R. padi*, *S. avenae*, *R. maidis*[c]
Barley virus G (*Solemoviridae*, *Polerovirus*)	BVG	*R. maidis*
Wheat leaf yellowing-associated virus (*Solemoviridae*, *Polerovirus*)	WLYaV	Vector not reported

APHIDS: PERFECT DISEASE VECTORS

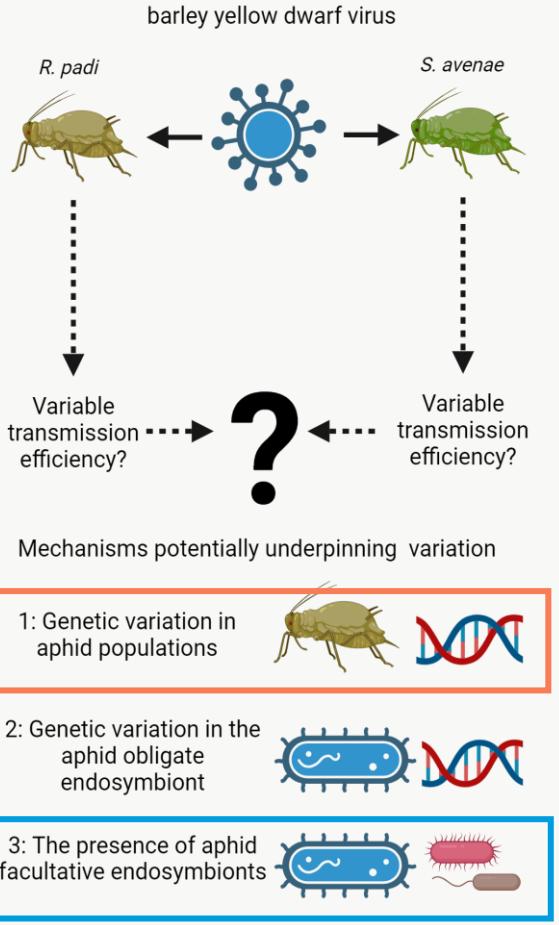

Main facultative endosymbionts:

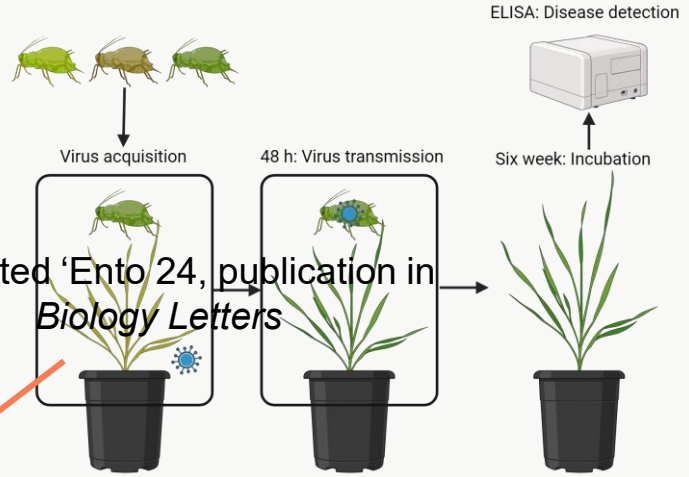

- *Hamiltonella defensa*
- *Regiella insecticola*
- *Serratia symbiotica*
- *Fukatsia symbiotica*
- *Aresnophonus spp.*
- *Rickettsia spp.*
- *Ricketsiella spp.*
- *Spiroplasma spp.*

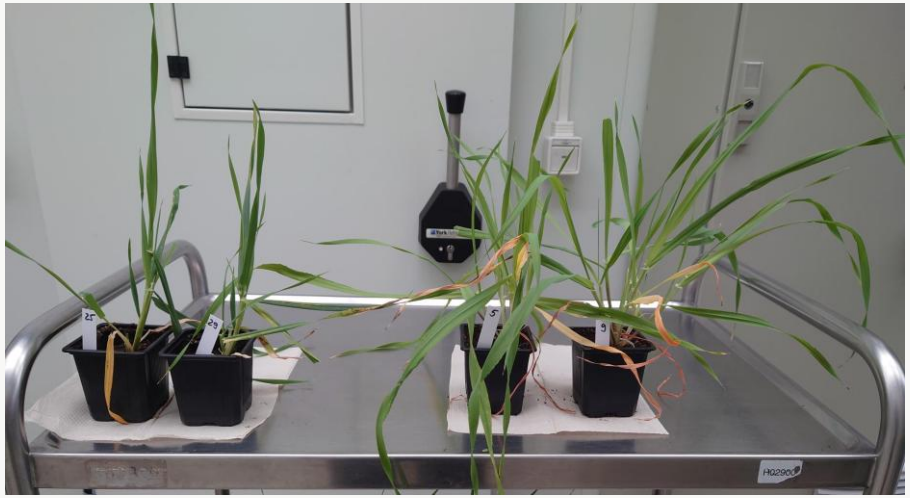

APHIDS: PERFECT DISEASE VECTORS

Presented ‘Ento 24, publication in *Biology Letters*

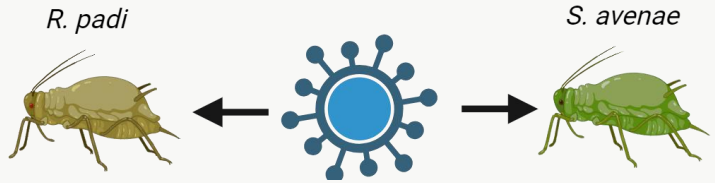

APHIDS: PERFECT DISEASE VECTORS

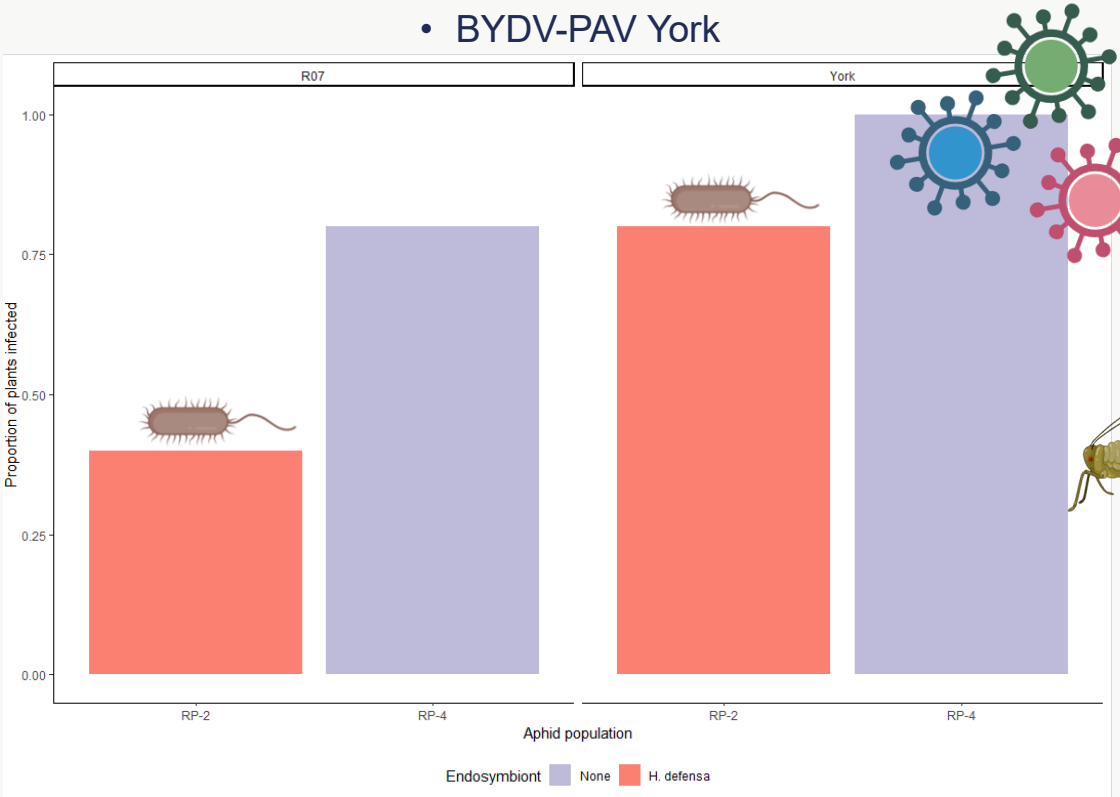

barley yellow dwarf virus

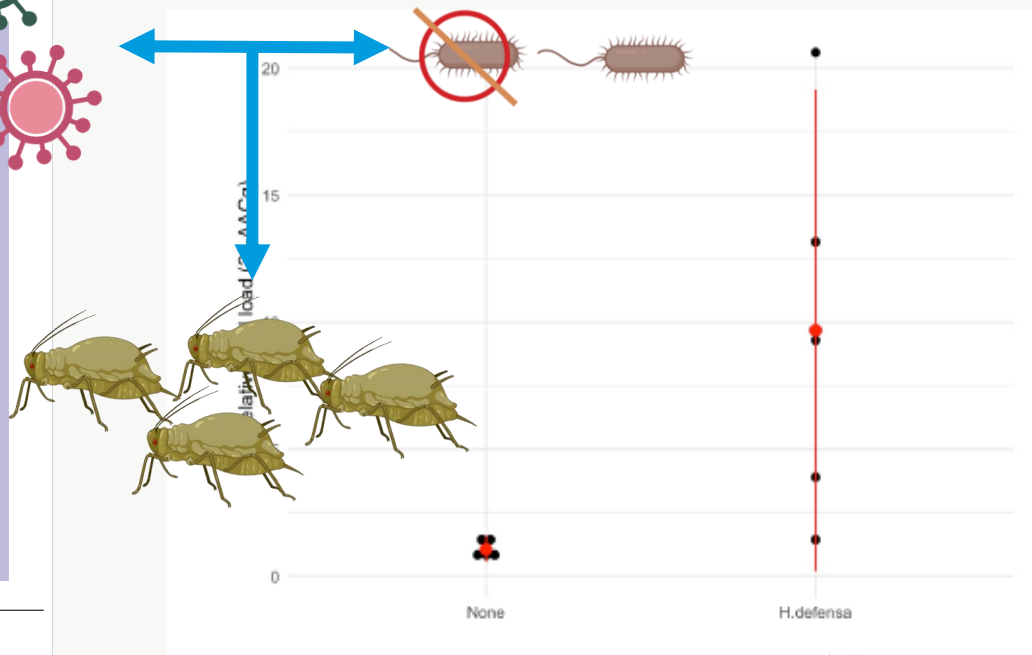

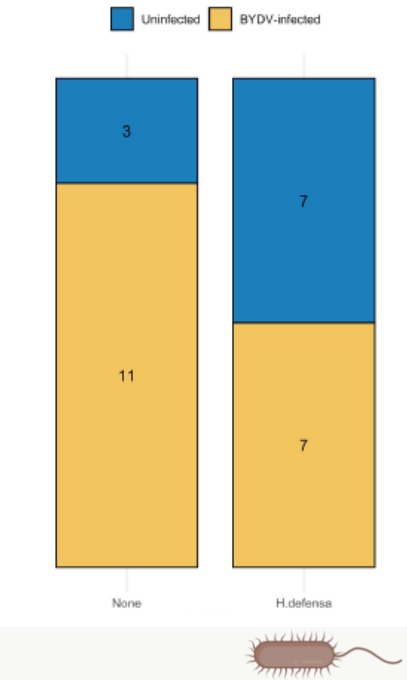

- Two vector populations
  - Same genotype
  - Different endosymbiont
- Two virus variants:
  - BYDV-PAV R07
  - BYDV-PAV York

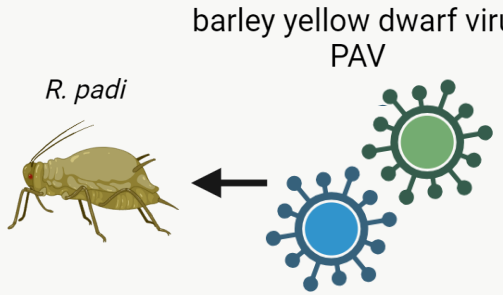

- Two vector populations
  - Same aphid line
  - Endosymbiont introduced through microinjection
- One virus variant:
  - BYDV-MAV York

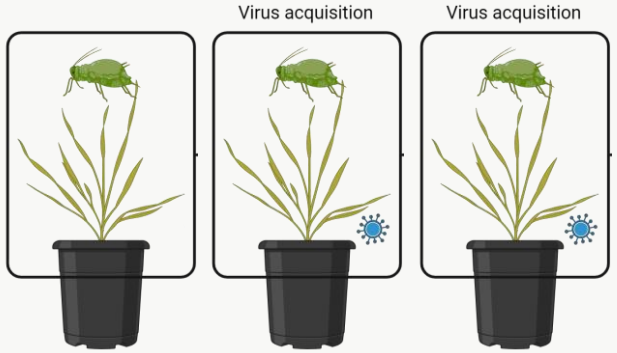

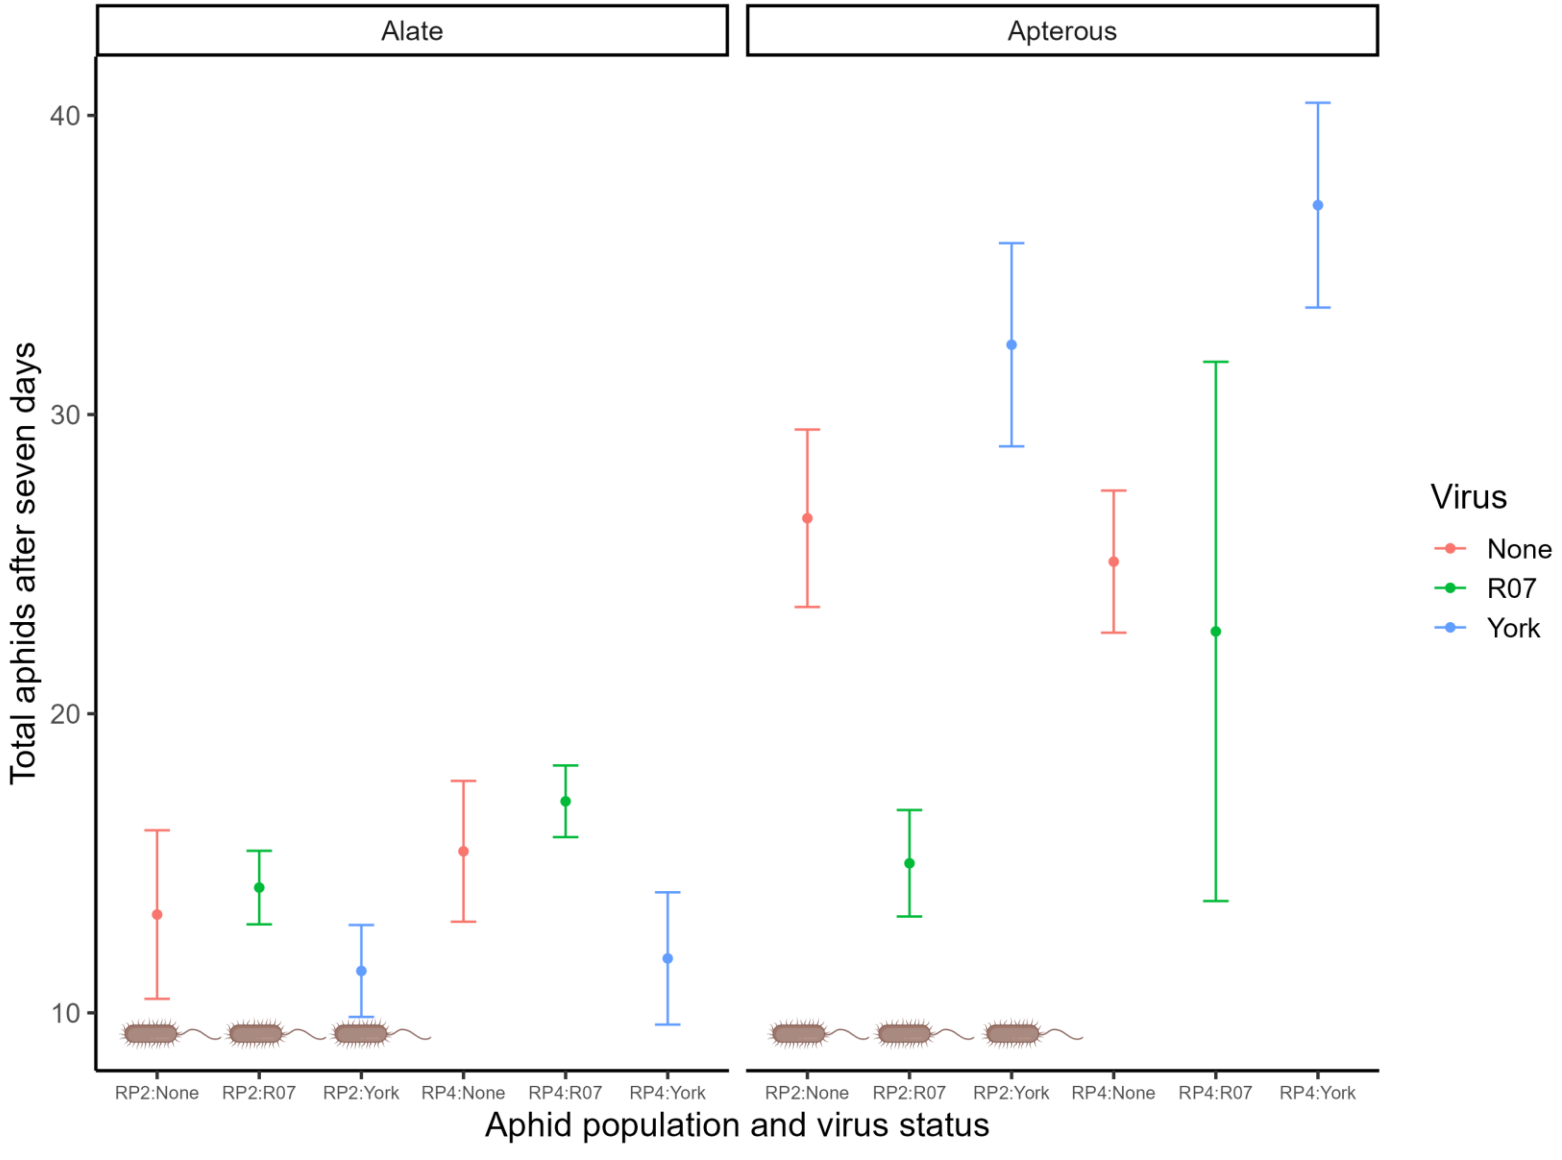

VECTOR MANIPULATION: VIRUS AND ENDOSYMBIONT

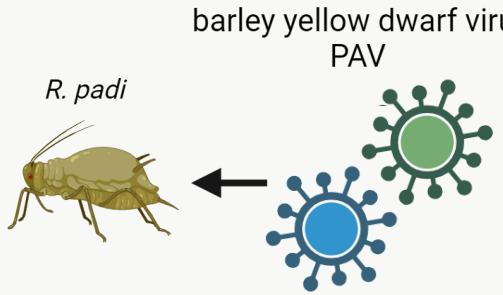

- Two vector populations
  - Same genotype
  - Different endosymbiont
- Two virus variants:
  - BYDV-PAV R07
  - BYDV-PAV York

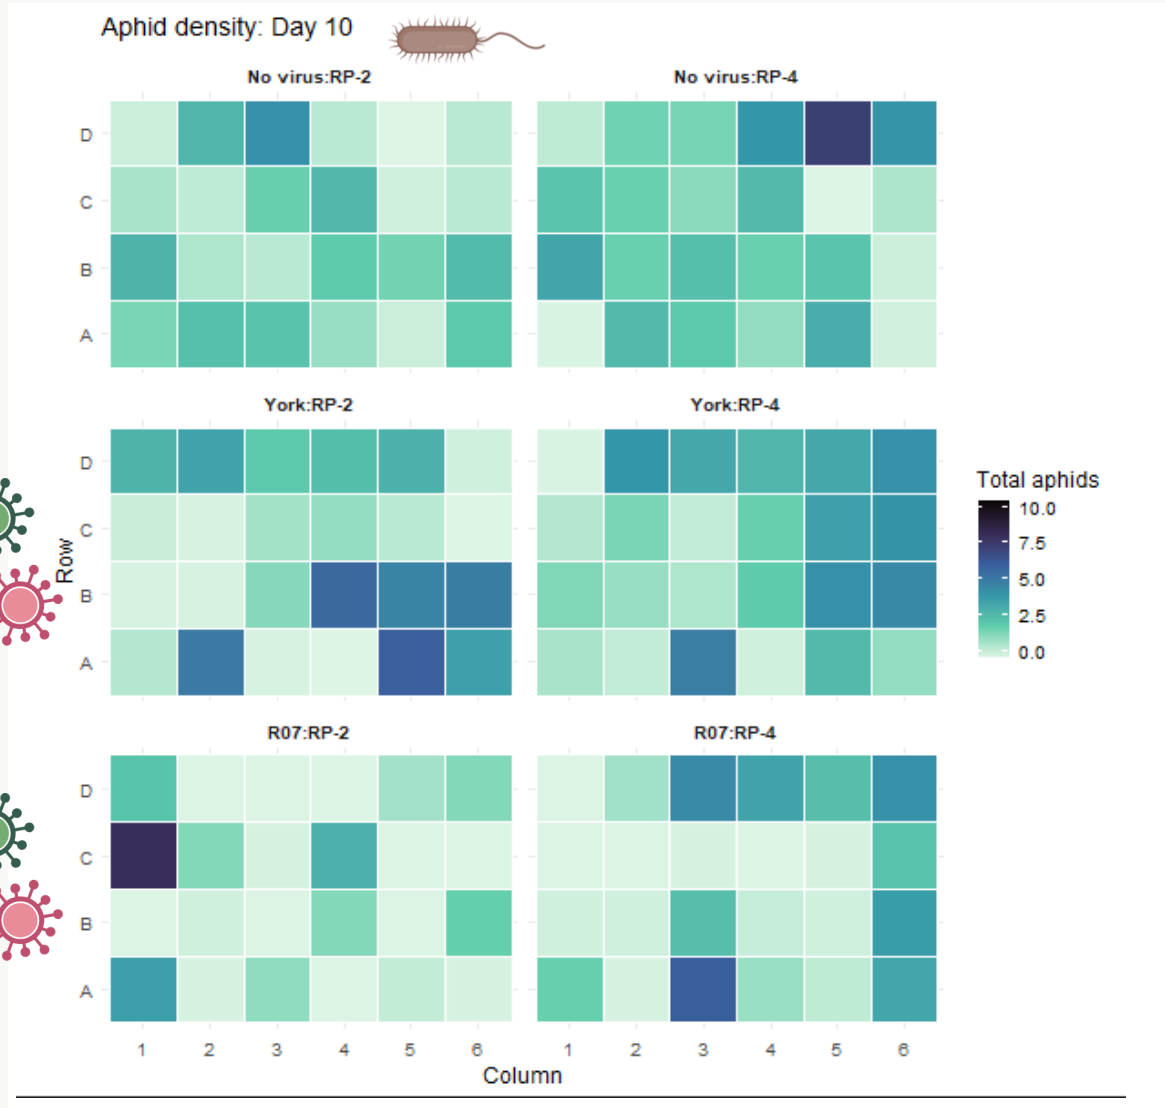

VECTOR MANIPULATION: VIRUS AND ENDOSYMBIONT

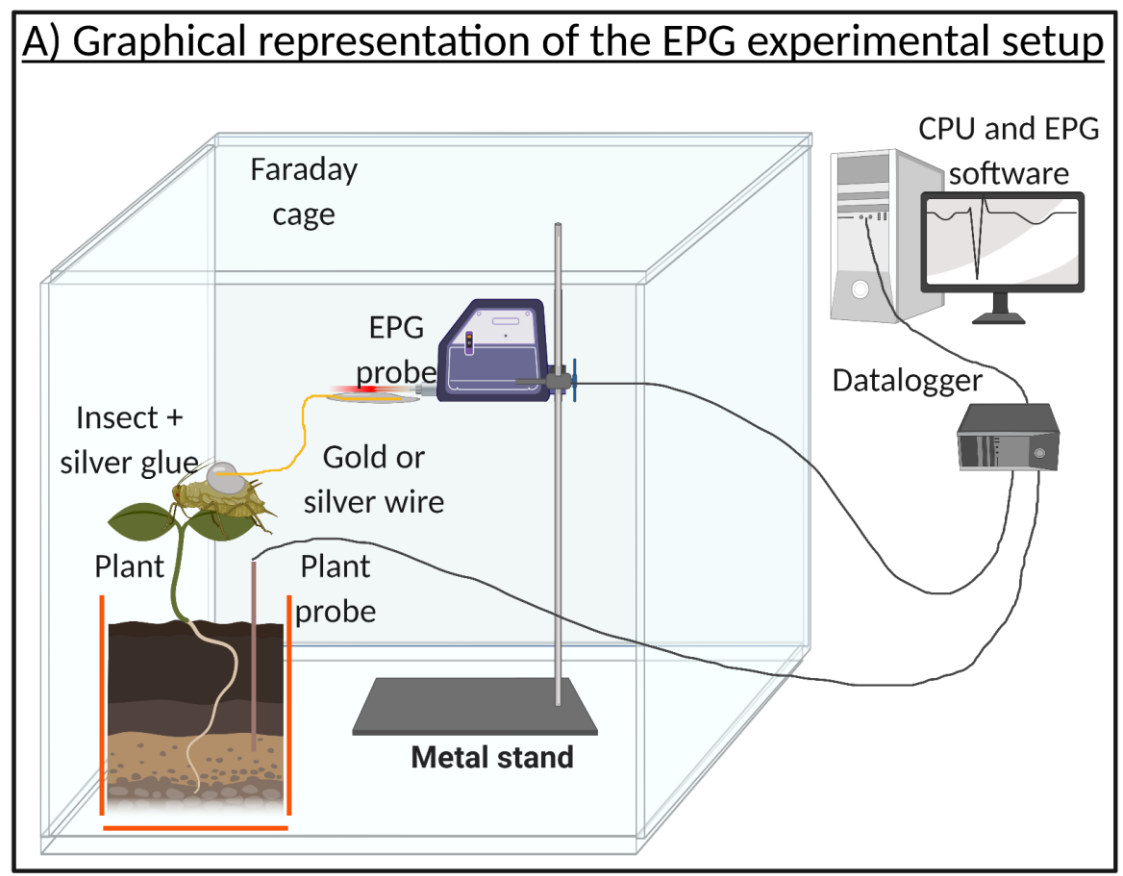

- Two vector populations
  - Same genotype
  - Different endosymbiont

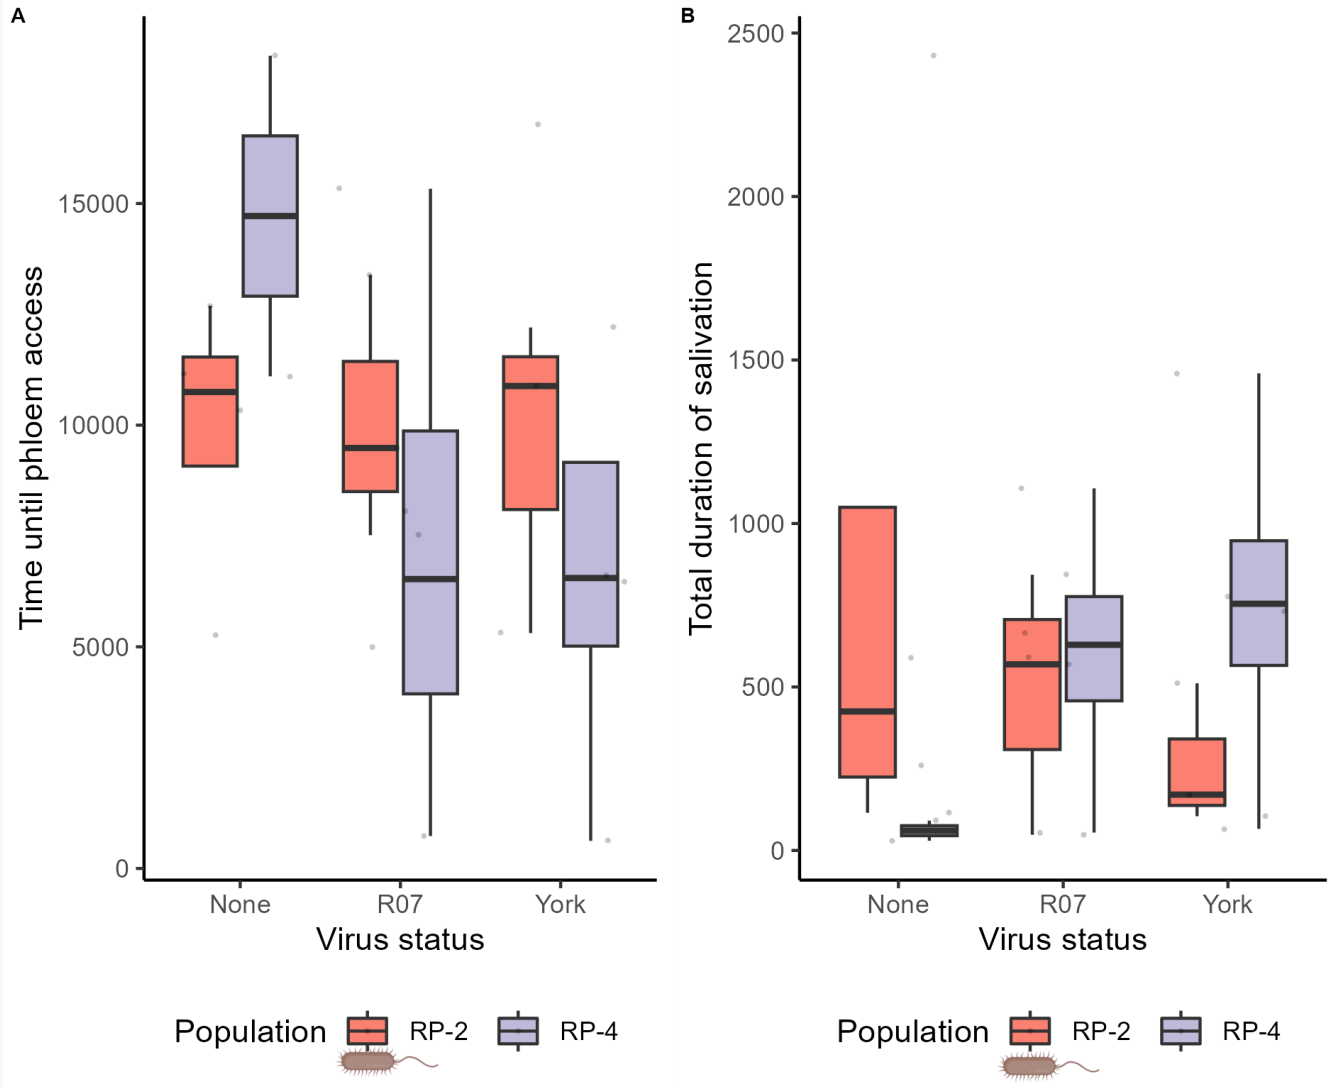

- Two virus variants:
  - BYDV-PAV R07
  - BYDV-PAV York

VECTOR MANIPULATION: VIRUS AND ENDOSYMBIONT

CONCLUSION

- Variable impacts of virus presence on vector reproduction - **potentially antagonised** by endosymbiont
- Possible virus / endosymbiont influences on vector dispersal – analysis ongoing
- Virus promotes phloem access and salivation **but** mediated by endosymbiont
